Bortezomib (bore TEZ oh mib)
Patient Education

US Brand Names: Velcade
Therapeutic Category: Proteasome inhibitor

What is this medicine used for?
Used to treat Multiple Myeloma.

How does it work?
Bortezomib works by killing rapidly growing cells. This drug will affect all fast growing cells, cancer cells and normal cells, in your body.

What should my doctor or nurse know before I take this medication?
- If you are allergic to any medicines.
- If you are taking other over the counter or prescription medicines, including vitamins and herbal remedies.
- If you are, or may be pregnant.
- If you are breast feeding.

How is this drug given?
- This medication can be used alone or in combination with other cancer medication.
- This medication is given into a vein only.

What are the general precautions when taking this medicine?
- Talk with your doctor or nurse before taking aspirin, aspirin-containing products, over the counter or prescription medications, including vitamins and herbal remedies.
- Drink 8 to 10 glasses of non-caffeinated liquid every day (unless told otherwise by your doctor or nurse).
- If you or your partner can get pregnant, use birth control during your treatment. Once completing treatment, discuss the timing for discontinuing birth control measures with your provider. (See Patient Teaching Sheet: Fertility)

What are the common side effects of this medicine
- Fatigue, malaise and weakness.
- Insomnia, dizziness and anxiety.
- You may experience numbness or tingling of your hands and feet after several doses of
Velcade.

- Transient (comes and goes) numbness in your groin.
- May cause Nausea and vomiting. Take anti-nausea medication as directed. Call for nausea and vomiting not controlled by prescribed medication and/or inability to eat and drink liquids. (See Patient Teaching Sheet: Nausea/Vomiting)
- Myelosuppression (drop in number of blood cells)
  May cause a drop in the number of white blood cells in your body. These cells fight infection. A drop in the number of these cells puts you at risk for infection (Neutropenia). You may be at an increased risk for getting an infection during your treatment. Talk to your doctor or nurse about your risk. Avoid people with infections, colds or flu when you are at risk. (See Patient Teaching Sheet: Neutropenia)
  
  May cause a drop in the number of platelets in your body (thrombocytopenia). Platelets help your blood clot. A drop in platelets puts you at risk for bleeding. You may bleed easily during your treatment. Talk to your doctor or nurse about your risk. Avoid injury to your skin and mucous membranes by using a soft toothbrush, electric razor, etc when you are at risk. (See Patient Teaching Sheet: Thrombocytopenia)

**Danger signals to report immediately to your doctor or nurse**

- Signs or symptoms of infection. This include a fever of 100.4 F (38 C) or greater, chills, severe sore throat, ear or sinus pain, cough, increased sputum or change in color, painful urination, mouth sores, wound that will not heal, or anal itching or pain.
- Severe nausea or vomiting or diarrhea not controlled by medication.
- Not able to eat or drink.
- Bleeding from your nose, mouth, gums, or in your urine or bowel movements. Bruising that does not heal.
- Feeling extremely tired, weak, dizzy or light headed.
- Progressive or worsening of numbness or tingling of extremities which can cause difficulty in walking or buttoning clothes.
